(Image credit: Shutterstock) Most people use a virtual private network (VPN) to browse the web securely away from home and work their way around restrictions on region-specific content or websites. So it's no surprise that you might want one on your Android smartphone. There are lots of scenarios in which you might use a VPN for such purposes, for example, when logging on to a public (and unsecured) Wi-Fi networks or logging into your Netflix account when abroad. Of course, you won't always have a laptop with you and may be carrying only your Android phone. In such cases, you might want to consider downloading an Android VPN app. See also: our dedicated list of the best working Netflix VPNs it worth downloading a VPN on my Android? There are two major reasons why a mobile VPN app installed on your Android phone can be of benefit: internet security and circumnavigating geographical restrictions. If you travel a lot and want to enjoy your favorite streaming services, like Netflix, BBC iPlayer, or Amazon Prime while on the road, a VPN app for your smartphone could be very useful. A good VPN app will trick the streaming service you're trying to access into thinking that you are still in a legitimate geographical location by routing your request through an intermediary server in the desired region. Do you often log on to public Wi-Fi networks with your Android phone? You should probably think about securing your data. With so much information stored on your phone, from login details to online accounts to personal financial information, it's a good idea to get some extra protection. Of course getting hold of Android antivirus makes sense, but with a VPN you can ensure your data is encrypted and almost impossible to access - even if you are logged on to a public network with questionable security features. That means as close to true online anonymity as you can get. ExpressVPN is our top rated #1 VPN for Android phones (Image credit: Future) (opens in new tab) What kind of VPN app is best for my Android? There are lots of VPN providers out there, from free VPN services to iOS users that require iPhone VPNs. Of course, Android users are no exception and that's why we've compiled our dedicated guide to the best Android VPNs available today. Do your research and choose an app that works best with your Android phone from our guide. And be aware there can be a large disparity between the price of these services, so be sure to look at competing products before deciding on a winner. In short, you'll want a service where the devs have really thought about how the VPN should work smoothly and intuitively on Android. It's also worth looking out to see whether the provider your eyeing up has a custom kill switch for Androids - an extra layer of protection that not all VPN apps are able to offer. Do I need to download a VPN app for my Android phone? Installing a VPN app on your Android is never a bad idea. It will not only make browsing safer, particularly when logged into public Wi-Fi networks, but also allow you to access content restricted to specific regions. And the best VPNs won't bog down your device's memory, either. Before you go ahead and download the app, though, you need to ask yourself how often you'll need to use it. If you're a regular traveler, keen to access content available at home on the go, or someone that frequently connects to unsecured Wi-Fi networks, then we'd seriously suggest you download an app. Read more: (Image credit: Mozilla) We've known about Mozilla's VPN service for a little while now, and now the company has released an Android app for beta testing. Mozilla has already released a browser extension for Firefox (opens in new tab) that provides free access to the service in the US, but apps for Android, iOS, Windows, macOS, Linux and Chromebook are also planned. The monthly cost is currently set at \$4.99 (about £4 / AU\$7), but Mozilla describes this as a "limited-time beta pricing", so it's safe to assume that this will increase when the service launches properly. The apps serve as true VPNs and offer full-device protection; they aren't just proxies that handle data from your web browser. They can be used to protect up to five devices as part of the monthly fee, and Mozilla says you'll be able to choose from servers in more than 30 countries. Join the queue! You can download the Android app from Google Play (opens in new tab) if you have an invite to the beta program, which you can sign up for here (opens in new tab) - but bear in mind that there is currently a waiting list. If you make it to the top of the waiting list, Mozilla will also provide access the Windows 10 app. Beta apps will also be made available for other platforms, but Mozilla hasn't yet indicated when these may be released. Looking for a free VPN? Check out our guide to the best Via Android Police (opens in new tab) What VPN would you recommend for an Android user who uses public WiFi quite often and wants to buff up their security? Welcome to our "Got Answers?" series (which is normally published each Thursday) where we are helping fellow members get answers to their tech questions. Are you the one who can offer advice or tips to help your fellow member with their questions? Do you have your own tech questions? Post them in our forums where you can receive answers from your fellow members. You use public WiFi on your Android device quite often, however, in this day and age, you want to be more secure, so you are looking for a VPN to install. This is where TechRepublic member indigofurr has found themselves and has turned to the TechRepublic community for assistance in helping them figure out which VPN to use. TechRepublic member indigofurr writes, "I'm looking for a VPN service for my Android since I'm on public WiFi a lot and want to buff up my protection. Right now I'm considering Surfshark because it uses IKEv2 protocol and it's stated that it drains less of your phone battery. I searched but couldn't really find other VPNs that offer IKEv2 for Androids, maybe you have some recommendations so I can do a comparison?" Are you able to help indigofurr with their question? Simply click the "Answer This" button below: The TechRepublic Forums is a community of IT Experts, where you can go to seek advice, share your knowledge, brainstorm, shoot the breeze and enjoy the camaraderie of your IT peers. So, if you haven't already - be sure to check out the forums today! More Tech Help Questions from the TechRepublic Forums See Also: Previous "Got Answers?" Question(s) When you plug your iPhone into your PC and look under My Computer, you'll see it show up under Scanners and Cameras in Windows, but if you want to drag and drop other types of files to and from your device you're out of luck. Android phones, on the other hand, let you treat them just like USB drives. (Note that this procedure is not identical for all Android phones.) Step by Step Connect your Android phone to your PC. On your Android device, slide down the notification drawer and tap where it says "USB connected: Select to copy files to/from your computer." On the next screen select Turn on USB storage, then tap OK. On your PC, an AutoPlay box should appear. Click Open folder to view files. Drag the item(s) you want to transfer from your PC's hard drive to your phone by moving them to the appropriate folder under Removable Disk. (In our case, we moved an album's worth of songs from our Music folder to the Media folder on our Android phone.) Press Stop on your Android phone to end the storage session before disconnecting the cable. The files should now be easily accessible on your phone. For instance, once we opened the Music player, our album was ready to play. If it's a different kind of file you're looking to open, try downloading the Astro File Manager app to locate it. Image: CNET Did you know that Google has a VPN for Android? It's called Google One VPN, and it's secure, fast, and incredibly easy to use. Google's take on the VPN offers a much-needed layer of security to your mobile device, especially when you're on the go. The Google VPN hides your IP address to prevent third-parties from tracking you and doesn't use the VPN connection to track or log your activity. Even better, the client libraries for the Google One VPN are open sources and the end-to-end systems will be independently audited in 2021. One thing that the Google VPN offers that many other solutions cannot match is that there is next to no noticeable speed reduction. That means you can leave the VPN running at all times without it interfering with your mobile experience. But how do you use this tool? Let me show you. SEE: Identity theft protection policy (TechRepublic Premium) What you'll need As of this writing, the Google VPN only works with Android, so you'll need an Android device--there are plans to add iOS, Windows, and macOS clients in the future. You'll also need to be in the US, as the VPN is currently only supported in that region, with more regions coming soon. The other thing you'll need is a 2 TB (or larger) Google Drive plan. That plan will cost you \$9.99/month, but if you're a Drive power user, that's a pretty cheap price, given the amount of space you're getting. Plus, you get the VPN service added on top of that, so it's a win-win. How to install the Google VPN Client Once you've upgraded to the 2 TB Google Drive plan, you should find Google VPN added to Google One at the next update. If you don't, you can head over to the Google Play Store and either install Google One or update it manually, as it should already be on your device. How to use the Google VPN Client Now it's time to enable that VPN client. On your Android device, open the App Drawer and launch Google One. In the Google One app, you'll see an entry for the VPN. To enable the service, tap Enable VPN (Figure A). Figure A Enabling the Google VPN is just a tap away. This will open a new window, where you must tap the On/Off slider until it's in the On position (Figure B). Figure B Enabling the Google VPN. When prompted, tap OK so Google can set up the VPN connection (Figure C). Figure C Okay the Google VPN connection. You should see a small key icon in the notification bar at the top of your display indicating the VPN is on (Figure D). Figure D The Google VPN is now enabled and is securing your connection. How to make it easier to enable/disable Now that you know how to turn the VPN on, let's make it a bit easier. Pull down your notification shade twice and then tap the pencil icon in the Quick Tiles window (Figure E). Figure E The Quick Tiles section of the Android notification shade. Locate the Google VPN tile, then tap and drag it into the Quick Tiles section at the top. Once you have it where you like it, tap the back arrow in the upper-left corner of the Quick Tiles section, and you're good to go. You can now enable/disable the Google VPN from the Quick Tiles section of the notification shade. Speed testing the VPN After enabling the VPN, I ran a quick speed test comparison (using speedtest.net) with the service on and with it off. The results are telling: With VPN on: 89.23 Mbps With VPN off: 93.74 Mbps Clearly the Google One VPN doesn't reduce your networking speeds by much. In fact, it's hardly noticeable, which is a huge plus for a VPN. For anyone looking to find a VPN that is as performant as it is secure, Google One VPN might be exactly what you're looking for.
